

# Lecture 15: Discrete Mathematics

**Course Title:** Discrete Mathematics

**Course Code:** MTH211

**Class:** BSM-II

## Objectives

The main aim of the lecture is to

- *define floor and ceiling functions,*
- *draw graph of floor and ceiling functions,*
- *define power function.*

## Real Numbers

In mathematics, a real number is a value of a continuous quantity that can represent a distance along a line. The real numbers include all the rational numbers, such as the integer  $-5$  and the fraction  $4/3$ , and all the irrational numbers, such as  $\sqrt{2}$  (1.41421356..., the square root of 2),  $\pi$  (3.1415...).

## Floor and Ceiling Functions

Let  $x$  be any real number. Then  $x$  lies between two integers called the floor and the ceiling of  $x$ .

Specifically,

$\lfloor x \rfloor$ , called the *floor* of  $x$ , denotes the greatest integer that does not exceed  $x$ .

$\lceil x \rceil$ , called the *ceiling* of  $x$ , denotes the least integer that is not less than  $x$ .

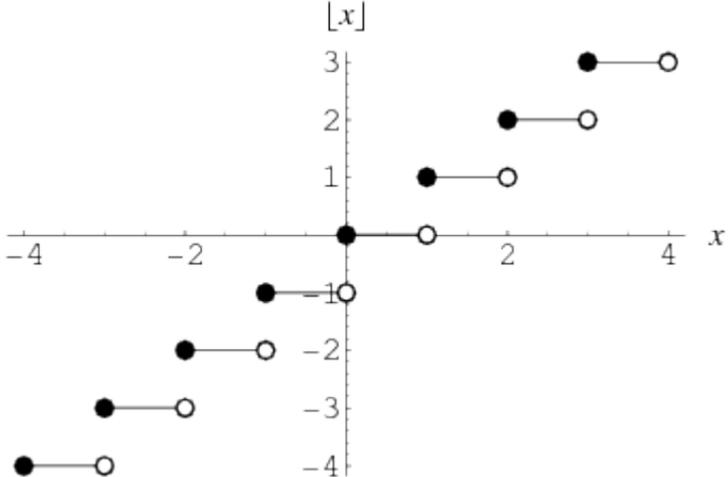

If  $x$  is itself an integer, then  $\lfloor x \rfloor = \lceil x \rceil$ ; otherwise  $\lfloor x \rfloor + 1 = \lceil x \rceil$ .

### Examples:

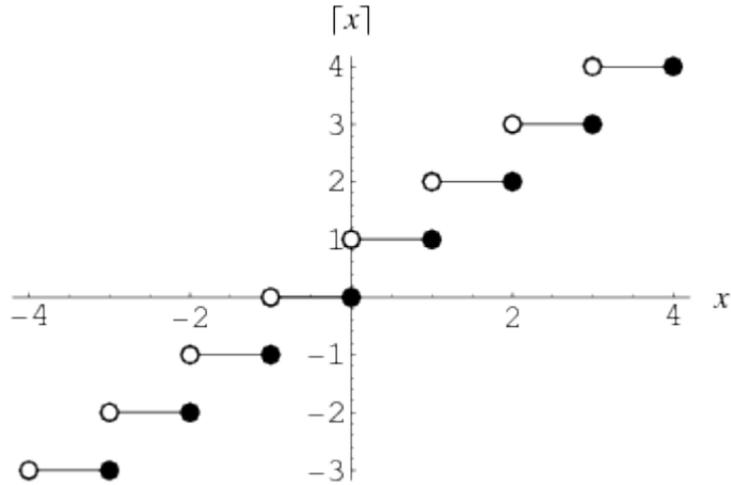

$$\lfloor 3.14 \rfloor = 3, \lfloor \sqrt{5} \rfloor = 2, \lfloor -\sqrt{5} \rfloor = -3, \lfloor 7 \rfloor = 7,$$

$$\lceil 3.14 \rceil = 4, \lceil \sqrt{5} \rceil = 3, \lceil -\sqrt{5} \rceil = -2, \lceil 7 \rceil = 7.$$

# Graph of Floor Function:

# Graph of Ceiling Functions:

**Power Function:**

A *power function* is a function that can be represented in the form

$$f(x) = kx^p ,$$

where  $k$  and  $p$  are real numbers, and  $k$  is known as the *coefficient*.

**Examples**

- The constant and identity functions are power functions because they can be written as  $f(x) = x^0$ , and  $f(x) = x^1$  respectively.
- The quadratic and cubic functions are power functions with whole number powers  $f(x) = x^2$  and  $f(x) = x^3$ .
- The square root and cube root functions are power functions with fractional powers because they can be written as  $f(x) = x^{\frac{1}{2}}$  and  $f(x) = x^{\frac{1}{3}}$ .
